SCLAK

smarter and safer access

You are using your smartphone to take photos, pay bills, measure your heart rate. Now you can use your smartphone to open the door of your house, garage or office.

No more physical keys that can be copied without you knowing.

Invite other people to access your premises by sending an email. You will be able to assign them a key that they can use only in certain days and times.

THE FUTURE IS KEYLESS: JOIN THE REVOLUTION

SMART

With SCLAK you can allow other people to access your premises. Simply send an invitation via email and define when they can access. No more physical keys to copy and manage, you are in control. The system saves an access list so that you can always verify who accessed your property and at which time of the day.

SAFE

All the communication between the Sclak and your smartphone is secure. We are using an NSA level protocol on top of Bluetooth 4.0, which is basically a very complicated way to say that you are safe. Your phone just got stolen? No worries you can always reset the access so that nobody can use it without your authorisation.

UNIVERSAL

Installing Sclak is easy. It's compatible with any electrical, electromechanical or electromagnetic lock in the world! No need to change the existing lock or to do expensive modifications. Just install it on the same power line that operates the lock and you are done.
